The rule, which was exceptionally severe, was mitigated by Pope Urban IV. in 1264, and the order then separated into two branches: the Urbanists, who followed the mitigated, and the Clarisses, who adhered to the original, rule. In 1436 St. Colette brought back a number of houses in France and Flanders to the observance of the rule of St.

Francis. The Poor Clares have given their name to a district of London—the Minorities—the site of the first house of the order founded in England (1263). They have now houses in this country and in Ireland.

The Act 23 Edward III., passed in 1349, enacted that no person should give alms to a beggar able to work. The support of the poor was undertaken by the church. By 27 Henry VIII., passed in 1535, and necessitated by the dissolution of the monasteries, a compulsory poor law was established. The 4th Elizabeth c. 2, passed in 1601, contained the germ of the present poor law. It directed parishes to relieve the blind, the lame, and the impotent, and appointed overseers of the poor. It was modified in 1662. In 1722 the workhouse system began. Between 1812 and 1832 the pauperism of England was a frightful burden, threatening ruin to the country, which was averted by the Poor Law Amendment Act, 4 & 5 William IV., c. 76, passed in August, 1834. It appointed a Central Board, divided the country into Unions, requiring workhouses to be built in each, and the paupers to reside in them and submit to a labour test, in place of obtaining outdoor relief, carrying with it little or no inconvenience. Prior to 1834 one person in twelve was a pauper, by 1849 the percentage was 6.2, by 1867, it had fallen to 4. Outdoor relief is still given, though on a more limited scale than prior to 1834, and some modifications of the Act have taken place, but its essential features still remain. In 1838 a poor law was passed for Ireland. To a less extent than in England has it tolerated outdoor relief. Prior to 1845 the care of the poor in Scotland was undertaken mainly by the Established Church of that country. The Disruption of 1843 so crippled it that a poor law became necessary, and was passed in 1845. It is essentially the same as that in England, but pauper children are not kept in the workhouse, or educated in workhouse schools, but are boarded out. [BOARDING-OUT.]

6. The term Papa, or Papis (father), has always been given by the Greek Church to presbyters, like the term Father now applied to a Roman priest. In the early centuries the bishops received the same title till, in a council held at Rome in 1076, at the instance of Gregory VII (Hildebrand), it was limited to the Bishop of Rome. Holding that office, being also Metropolitan of Rome and primate, and claiming to be the earthly head of the Church universal, it is in the last-named capacity that the term Pope is held to be specially applicable. (CONSULVE.) It has been a matter of controversy among Roman Catholics whether the authority of the Pope was above or below that of the General Council. That of Pisa (1409), claiming to be a General Council, deposed two rival popes, and appointed a third; but the two former repudiated the authority of the Council, and exercised their functions as before. The Council of Constance (1414-1418) also deposed two rival popes and elected one. In 1571, Pope Zachary being consulted as to the right of the warlike French to depose their incompetent king, Childeric, and raise Pepin, the able Mayor of the Palace, to the sovereignty, sanctioned the proceeding. Pepin, in return, became his friend, and handed over to the Church the Exarchate and the Pentapolis. Charlemagne, in 774, confirmed and enlarged the gift. In 1076 or 1077 the Princess Matilda, daughter of Boniface, Duke of Tuscany, made the Holy See hear to her extensive possessions. This arose "the States of the Church" which figured on the map of Europe as an independent sovereignty till Sept. 20, 1870, when the troops of Victor Emmanuel, King of Italy, entered Rome, non-

ally in the interests of order, and took possession of the place for the Italian Kingdom. On July 2 and 3, 1871, the seat of government was moved thither. It still continues the metropolitan. No interference took place with the Pope's purely spiritual authority, but much with his temporal possessions and revenues. [ESCALIFELAY.]

On the strength of his allegations, various persons, including Viscount Stafford, were executed. Gradually evidence arose that the whole story was a fabrication, and that the people who had been capitally punished were all innocent. On May 8, 1685, Oates, who had received a pension of £2,000 for his revelations, was convicted of perjury, heavily fined, pilloried, and publicly flogged. He survived, deservedly despised, till 1705.

* 1. *Bot.*: Poplar; a genus of Salicaceae. Catkins drooping, their scales usually jagged; disc cup-shaped, oblique, entire. Males, stamens four to thirty; females, stigmas two to four-lobed; capsule two-celled, loculicidal. Known species eighteen; from the north temperate zone. Two, *Populus alba*, the Great White Poplar or Abule, and *P. tremula*, the Trembling Poplar or Aspen, are indigenous. *P. nigra*, the Black Poplar, is only naturalized. The first is a large tree with downy, but not viscid buds, roundish, cordate, lobed-toothed leaves, glabrous above, downy and very white beneath, ultimately becoming glabrous on both sides. It grows in moist places and mountain woods. The timber is white, soft, and used only for coarse work. The bark is said to be useful in stranguery. Sir Joseph Hooker considers *P. canadensis*, the Gray Poplar, to be only a subspecies of it. For the second species, see Aspen. *P. nigra* has viscid buds, leaves rhombic, deltoid, or suborbicular, finely crenato-serrate; at length becoming glabrous. It grows in moist places, on river banks, &c. The wood is light, and not very valuable. It is used for carving, or burnt for charcoal, and the bark employed for tannin. *P. monilifera* is the Black Italian Poplar, *P. fastigiata*, the Lombardy Poplar, and *P. canadensis*, the Canadian Poplar. The buds of *P. nigra*, the Himalayan *P. balsamifera*, *P. euphratica*, &c., are besmeared in winter with a resinous, balsamic, bitter, aromatic exudation, called Tacamahac, considered to be diuretic, and antiscorbutic. The bark of *P. euphratica* is given in India as a vermifuge.

A. As substantive:

Art.: A brittle material intermediate between glass and pottery, being formed of two substances, fusible and infusible, the latter enabling it to withstand the heat necessary to vitrify the former, thus producing its peculiar semi-transparency. The infusible material is alumina, called kaolin; the fusible substance is felspar, and is called petuntse, both Chinese terms. There are two kinds, hard and soft (*porcelaine dure* and *porcelaine tendre*); the hard body has more alumina and less silica and lime. Oriental porcelain is of two kinds, ancient and modern; the latter class includes imitations and reproductions. The manufacture began in China between 185 B.C. and 87 A.D., and reached its perfection during the Ming dynasty (1368-1644). The rarest Chinese wares are of the Tsing dynasty (265-419 A.D.), the Soui (581-618), and the Tang (618-907). The Teikou porcelain (974-959) is so valued that fragments are worn as personal ornaments. Ware of the Song dynasty (960-1279) is also highly prized. Porcelain came by trade into Persia and Egypt, and was known in Syria in the twelfth century. Marco Polo in the thirteenth century described the Chinese method of manufacture from personal observation. First imported into Europe by the Portuguese in 1520. In Japan the porcelain manufacture began before 27 A.C., with a whiter body and more brilliant glaze than that of the Chinese. It is doubtful if it was ever made in Persia. In Europe, Boettcher, a Saxon chemist, found kaolin while seeking the philosopher's stone; and Augustus II., elector of Saxony and king of Poland, established and placed under his control the famous Meissen factory at the castle of Albrechtsburg in 1710; forty years later 700 men were employed. In Vienna, Stölzel, who escaped from Meissen in 1720, began the Austrian factory, which in 1785 employed 500 men; another was established in Berlin by Frederick the Great. During the eighteenth century, works were begun in Russia, Holland, Denmark, Spain, Portugal, Switzerland, and Italy. In France, soft porcelain was made at St. Cloud in 1695. Comte de Bauxes-Lauragnan, in 1758, found kaolin near Alençon, and porcelain was made at St. Yrieux, near Limoges. The Sevres manufactory was first established at Vincennes in 1740, and moved to Sevres in 1756. In France, the manufacture of soft porcelain extends from 1695 to 1770, after which date the hard body of Sevres takes its place. In England, William Cookworthy, a chemist of Plymouth, found kaolin at Tregoning, near Helston, in Cornwall, and his patent of 1768 was worked at Plymouth for two or three years, when the works were removed to Bristol. At Chelsea

It occurs in the south of Europe, and the north and west of Africa, is about twenty-eight inches long, exclusive of the tail, about four inches high. It is somewhat heavily built, with obtuse head and short horns. The head, fore quarters, and under surface are clothed with short spines inter-mixed with hairs, crest on head and neck, hind quarters covered with long sharp spines, ringed with black and white, and erectile at will. They are but loosely attached to the skin and readily fall out, a circumstance which probably gave rise to the belief that the animal was able to project them at an enemy. It is a purely vegetable feeder, and lives in holes in the rock, and burrows in the ground. The Hairy nosed Porcupine is *H. leucurus* (or *horvathicus*) from Syria, Asia Minor, and India; and the Bush-tailed Porcupines belong to the genus *Atherya*. Geol.: A name used by some petrologists for the porphyritic orthoclase rocks which are free from quartz. Some, however, include varieties in which the orthoclase constituent is more or less replaced by oligoclase. Many porphyritic dolerites have been also included under this name. By the presence of hornblende it often approaches the composition of a syenite (q.v.) with which it is frequently associated.

Def. et.: A term originally applied to a rock having a purple-colored base, with enclosed individual crystals of a felspar. It is still used by some petrologists as a generic name for all rocks consisting of a felsitic base, with felspar crystals. Rocks of varied mineralogical composition, origin, and of various colours, having however been included under this name. English and most American petrologists use it in its adjectival form only. Thus, any rock in which crystals of felspar are individually developed, irrespective of the mineralogical composition of the whole, is said to be porphyritic.

It is found on the coasts of Scandinavia, and ranges as far north as Baffin's Bay and as far west as the coast of the United States. Southwards its range is limited, and it is unknown in the Mediterranean. It feeds on fish, and was formerly esteemed as an article of food. A good port-wine should possess body and aroma, a full and rich colour, moderate finiteness, and be neither too sweet nor too rough. The proportion of proofspirit varies from 20 to 30 per cent. It is frequently adulterated, both before it reaches this country and after its arrival here, sometimes by the addition of inferior wines or elderberry juice, at other times by diluting with water, adding a cheap spirit, and restoring the colour by means of logwood or some other dye. A little powdered catechu is also occasionally added to produce a rough and astringent flavour and to ensure a fine crust.

• Posts seem to have been first established for the conveyance of government messengers or private travellers rather than of letters. The ancient system extensively existed in the provincial parts of India till the introduction of railways narrowed the sphere of its operations. An important traveller, wishing to go to Europe, wrote to the European authorities of the district, who sent out instructions to the heads of the several villages to have relays of hallocks or palanquin bearers at fixed stages along the intended line of route. If he arrived too late he had denunciate to pay to all who lost time waiting for him. Till recently the same system, but with post-horses, extensively prevailed in the West. In Europe it was generally a government monopoly; in England it was conducted (and more effectively) by private enterprise. [6]

• Cyrus, the founder of the Persian empire, is credited with the first use of posts for letters. Probably the earliest were government despatches; then private letters would be taken surreptitiously, and finally arrangements would be made for doing so as a government monopoly. Despatches sent by Alaxandros (Xerxes) throughout the Persian empire are mentioned in Esther 1: 22; iii. 12-15; viii. 5-10, 13, 14; ix. 20, &c. • James I., in 1619, established a post office, and Charles I., in 1635, a letter-office for England and Scotland, but these extended only to the principal roads, and the times of carriage were uncertain. In the latter year the charge for a single letter under eighty miles was 2s., under 140 it was 4s., above 140 it was 6s., on the borders, and in Scotland 8s. The Parliament of 1643 framed the Act which provided for the weekly conveyance of letters into all parts of the kingdom, and a regular post-office was erected closely resembling that now existing, and with rates of postage which continued till the days of Queen Anne. In 1660 the members of the House of Commons claimed that their letters should be carried free. The loss to the revenue through this franking system was £225,000 in 1715, and £170,700 in 1763. In 1683 a metropolitan penny post was established. In 1791 this post was improved, but the price of the postage was doubled. On Sept. 22, 1829, the seat of the post-office was transferred from Lombard-street to St. Martin-le-Grand. In 1829 Rowland Hill brought forward his scheme for a penny postage throughout the United Kingdom. It came into operation on Jan. 10, 1840, on the scale of a penny for every letter below half an ounce in weight. In 1839 the number of letters carried was 75,967,572. The first year of the reduced tariff it rose to 168,768,344, and has since continued to advance year by year, proportionately quicker than the population. A money-order office, which had languished since its origin in 1793, was developed in 1840. Street letter-boxes were first erected in 1855. On June 5 of that year, a Treasury warrant was issued establishing a post for books, pamphlets, &c. Post-office savings banks were added in 1861. In 1869 the post-office was empowered to purchase the electric telegraphs, and began public telegraph business on Feb. 5, 1869. In 1870 the foundation-stone of a new General London Post-office was laid; it was opened in 1873. Halfpenny post-cards, and the uniform postage of 4d. for newspapers, began Oct. 1, 1870. On October 5, 1871, the weight for 1d. was advanced to an ounce, a halfpenny being fixed for each additional ounce. In 1885 the parcels post with prepayment began. On October 1 of that year the system of six-penny telegrams first came into operation. On June 22, 1897, the weight for letters for 1d. was advanced to four ounces; and on Christmas Day, 1898, the (partial) Imperial postage of 1d. per half-ounce came into operation.

pöt-äss, pöt täs's q, s. [POTASH.] [POTASSIUM-HYDRATE.]

pö-täs-sa mde, s. [Eng. potass(ium) and tautie.]

Chem. (Pl.): Potassium amides. The mono-compound KH_2N is obtained by gently heating potassium in ammonia gas. It is an olive-green substance, melting a little over 100° . Tripotassamide, or nitride of potassium, K_3N , is obtained when monopotassamide is heated in a close vessel. It is a greenish-black substance, taking fire spontaneously when exposed to the air. In contact with water it is decomposed, yielding ammonia and potassium hydrate.

pö-täs-sic, s. [Mod. Lat. potass(ium); Eng. sulph. suff. -ic.] Of or pertaining to potassium; containing potassium.

pö-täs-si-üm, s. [Latinised from potash (s.v.).]

Chem.: Symbol, K; atomic weight, 39. A monad metallic element, discovered by Davy in 1807, and very widely diffused through the vegetable, mineral, and animal kingdoms. It usually exists in combination with inorganic and organic acids, and when its organic salts are burnt, they are resolved into carbonate, from which all the other salts of potassium can be prepared. It may be obtained by electrolysis, but is now produced in large quantity by distilling in an iron retort an intimate mixture of charcoal and carbonate of potassium, a condition readily obtained by igniting crude tartar in a covered crucible. It is a bluish-white metal; sp. gr. 865, being the lightest of all the metals except lithium. At 0° it is brittle and crystalline; soft at 15° , and may be easily cut with a knife; fluid at 62.5° , and at a red heat distills, yielding a beautiful green vapour. Thrown upon water, the metal decomposes it with great violence, forming hydrate of potassium, whilst the escaping hydrogen takes fire, burning with a rose-red colour. It can only be preserved in the metallic state by immersing it in rock oil.

potassium alloys, s. pl.

Chem.: Alloys formed by fusing other metals with potassium. The arsenide and antimonide (the only important forms), heated with the alcoholic iodides, yield the arsenide, &c., of the alcohol radicals.

potassium-bromide, s.

Chem.: KBr . Formed by the action of bromine on potassium, or by neutralising hydrobromic acid with potash. It crystallizes in brilliant cubes, having a sharp taste; sp. gr. 2.99; is more readily soluble in hot than in cold water, and is slightly soluble in alcohol. By oxidising agents it is converted into bromate.

potassium-carboxide, s.

Chem.: $K_2C_2O_2$. A highly explosive compound formed sometimes in the manufacture of potassium, and when potassium is heated

to 80° in presence of carbonic oxide. It is first of a gray colour, and then becomes dark red. The gray compound has the composition K_2CO ; the red body can be preserved under mineral naphtha. In contact with water it explodes with great violence.

potassium-chloride, s.

Chem.: KCl . Occurs native as sylvite, and is formed when potassium is burned in chlorine, and when potash or carbonate of potash is neutralized with aqueous hydrochloric acid. It crystallizes mostly in cubes, rarely in octahedrons; sp. gr. 1.95; tastes like common salt, melts at a low red heat, and at a higher temperature volatilizes unchanged. It is very soluble in water, one part of the salt dissolving in 2.85 parts of water at 15.5° ; is slightly soluble in strong alcohol, but wood spirit dissolves it more readily. It forms crystallizable double salts with most of the metallic chlorides.

potassium-ethyl, s.

Chem.: C_2H_5K . Not known in the separate state, but in combination with zinc-ethyl by treating that compound with potassium.

potassium-hydrate, s.

Chem.: KHO . Potash. Potassa. Caustic potash. Produced by dissolving protoxide of potassium in water, but generally prepared by adding two parts of quicklime, slaked with water, to a solution of one part of carbonate of potassium in twelve parts of water, and boiling the mixture for some time. After standing, the clear liquid is siphoned off and evaporated in iron or silver basins. To remove several of the impurities it is subsequently treated with alcohol. After fusion it is a white, hard, brittle substance, sp. gr. 2.1, melts below redness to a clear liquid, volatilizes at a red heat, dissolves in half its weight of water, and in nearly the same quantity of alcohol. It has an acrid taste, is a powerful caustic, decomposes most metallic salts, and at a high temperature acts with great energy on nearly all substances.

potassium-iodide, s.

Chem.: KI . Obtained by direct union of iodine and potassium, and by neutralizing hydroiodic acid with potash. It crystallizes in cubes, which are sometimes transparent, often opaque; sp. gr. 2.99. It has a sharp taste, melts below a red heat, and at a moderate red heat volatilizes without change; is soluble in 7 part of water at 16° , and in 5.5 parts alcohol at 12.5° . A solution of this salt dissolves free iodine, forming a dark-brown solution. It is much used in medicine.

potassium oxides, s. pl.

Chem.: Potassium forms three oxides: (1) Protoxide, K_2O , formed when potassium is exposed to dry air at ordinary temperatures, is white, very deliquescent and caustic, and unites with water so energetically as to produce incandescence; (2) Dioxide, K_2O_2 , is formed at a certain stage in the preparation of the tetroxide, and when the latter substance is decomposed with water; (3) Tetroxide, K_2O_4 , is produced when potassium is burnt in dry air or oxygen. It is a chrome yellow powder which is reduced to protoxide when heated in an atmosphere of nitrogen, and to the dioxide when dissolved in water, oxygen in each case being evolved.

potassium-sulphides, s. pl.

Chem.: Potassium unites with sulphur in five different proportions: K_2S , protosulphide, obtained, but in a state of doubtful purity, by igniting sulphate of potassium in a covered crucible with finely divided carbon. It has a reddish-yellow colour, is deliquescent and caustic. K_2S_2 , disulphide, formed by exposing the sulphurate to the air, is obtained as an orange-coloured fusible substance. K_2S_3 , trisulphide, obtained by passing the vapour of carbonic disulphide over ignited potassium carbonate. K_2S_4 , tetrasulphide, formed by reducing sulphate of potassium by means of the vapour of carbonic disulphide. K_2S_5 , pentasulphide, obtained from any of the above sulphides by boiling them with excess of sulphur until fully saturated. All the sulphides have an alkaline reaction and smell of sulphidic acid.

pö-tä-to, po-tä-toe, s. [Sp. *potato*.] [BATATAS.]

Bot., Hort., Agric., &c.: *Solanum tuberosum*, a well-known plant, the tubers (dilated branches) of which are eaten. It is a native of Chili and Peru. Some think that it was first brought to Spain from the mountains near Quito early in the sixteenth century. Thence it spread to Italy and Austria. Sir Walter Raleigh is supposed to have brought it to England in July, 1586, having obtained it from the Virginian colonists whom he had taken out in 1584. Gerard, in his *Herbals*, figured it in 1597 as "the potatoe of Virginia," whence he said he had obtained its roots. Sir Walter Raleigh cultivated potatoes on his estate of Youghal, near Cork. For the next century and a half they were regarded as garden plants only. In Scotland they were not cultivated as a field crop till 1732. They gradually made way to the important position which they now occupy in British agriculture. Many varieties are grown, differing in earliness, form, size, colour, &c. They are sometimes preserved through the winter in pits dug in the ground, and lined with straw. A raw potato scraped is a good application to burns and scalds. [POTATO-STARCH.]

potato discase, s.

Veget. Pathol.: A disease of murrain produced by a fungus, *Peronospora infestans*. It generally first attacks the leaves and stems of the plant, forming brown spots upon them in July and August. By this time, the fungus which first penetrated the tissue of the leaf, has thrust forth through the stomates its conical-bearing filaments. The leaves soon afterwards die. Next the tubers are attacked and decay, either in a moist manner, attended by a disagreeable odour, or by a drying up of the tissue. Sometimes the term potato-disease is limited to the first of these kinds of decay, but they are closely akin, the one form passing into the other. Possibly an excess of rain in particular seasons created a predisposition to the attacks of the fungus. Too strong manuring, and the cutting up of seed potatoes have also been suggested as predisposing causes. The potato-disease first appeared in America. In 1845-1847 it caused the failure of the potato crop in Ireland, producing famine. [FAMINE.] It has never since completely disappeared, and in 1860 was nearly as formidable in some places as on its first appearance. When it is prevalent, the potatoes should be powdered with flowers of sulphur before being planted. They should be put early in the ground, and the haulm removed when the disease manifests itself.

The siliceous nodules are hard with quartz crystals, but frequently contain calcite with acicular goethite, the calcareous ones are lined with calcite crystals, but frequently contain isolated crystals of quartz, some of which present the form of the primitive rhombohedron. They appear to have been formed in the dolomitic conglomerates. According to Green, this name has also been applied to certain hollow limestone pebbles, which have been converted into dolomite, their interiors being lined with crystals of the same substance.

2. Precedence.

3. *Precession of the equinoxes*.

(1) *Astron.*: The going forward of the equinoxes. The arrival of the sun at the point Aries a little earlier than he might be expected to reach it was first observed by Hipparchus about 150 B.C. Depending on the phenomena does, for its explanation, on the law of gravity, Hipparchus could not account for it, &c. Isaac Newton was the first who did so, &c. that his newly discovered law of gravitation explained the precession of the equinoxes. It was a confirmation of the accuracy with which he had read the law itself. Excepting only the two equinoxes, the plane in which the sun moves in his orbit and that in which the earth rotates do not coincide. By the law of gravitation one body does not attract another in mass, but acts on its separate particles. The sun then does not attract the earth as a whole, but tends to pull the parts nearest it away from those in proximity to the centre, and the centre again away from those on the other side. The bulged-out equatorial zone is specially liable to be thus acted upon, and, but for the rotation of the earth, would be so drawn down towards the equator that it and the equator would ultimately be in one plane. The earth's rotation, however, modifies this action, and simply causes the points at which the earth's equator intersects the plane of the ecliptic to move slowly in a direction opposite to that in which the earth rotates. This is what is denominated the precession of the equinoxes. It is generally associated with the sun, but the moon is twice as potent in producing it; owing to her comparative nearness to the earth she is able to produce a greater dilated effect on the nearer and more remote portions of our planet. The annual motion of the first point of Aries is about 50", and about 2587 years will be required for the entire revolution. [Aries.]

"The portion of the *præcession* of the equinoxes attributable to the sun is called *solis præcession*, &c. that produced by the moon *lunaris præcession*, &c. also. *Pop. Astron. vol. i. ch. 2.*

1. A governor, a commander, a chief magistrate; specif.:
(1) A title given to several officers, military, naval, and civil, in ancient Rome. Thus, in the time of the kings the officer appointed by the king to act as his deputy when he was compelled to leave the city was called the Praefectus Urbis, or Prefect of the City. Later, during the earlier ages of the republic, when both consuls were required for military service, a Praefectus Urbis, was named by the Senate to act during their absence. He must have held the office of consul, and he enjoyed during the period of his office the same powers and privileges within the walls as the consuls themselves. In times of dearth or famine a commissioner was appointed to procure supplies, his official title being Praefectus annonae, or Prefect of Corn. In war the whole body of the cavalry was under the command of an officer, also styled a Prefect. The captain of a ship of war was called Praefectus classis, and the admiral of a fleet, Praefectus classis. Under Constantine the Prefects became governors of provinces.

He is exempt from taxation and tolls; his person cannot be arrested, nor his goods distrained upon. The palaces which he uses as dwellings are exempt from taxation, as is the dissolved Holyland House, whose precincts still afford sanctuary from civil process.
2. *Political:* All land in theory is held of the king. He can dissolve or prorogue parliament, but cannot prolong it beyond seven years. He can refuse assent to a bill passed by both Houses. He can, with the advice of his Privy Council, issue proclamations, binding only, however, in so far as they do not clash with existing laws. He is not bound by an Act of Parliament unless expressly named therein. He can prevent a subject from leaving the kingdom, by a writ of *in arbor captus*, and compel the return of a subject from abroad. He is the fountain of honor, and by 24 Car. II. *c. 2* he has reserved the command of the army and navy. He alone can coin money, grant charters to corporations, and establish markets and fairs. He is guardian of imbees, idiots, and idiots.
3. *Judicial:* The king is the fountain of justice, and the Supreme Court of Appeal, but he cannot order tribunals contrary to the law, nor can he add to the jurisdiction of the courts. He may intervene in all litigation where his own rights are concerned, or the interests of public justice demand it.
4. *Historical:* The statutes 26 Henry VIII. *c. 1* and 1 Eliz. *c. 1* recognize the king as the Supreme Head of the Church. He convenes and dissolves Convocations (q.v.) and nominates to vacant bishoprics [But non-Canon (q.v.) but he cannot now see in England, though he may do so in the Crown colonies].
5. *Feudal:* A few important feudal dues are still the prerogatives of the king, as in the case of transgression of hedges, roadways, or rivers, and of large, etc. In theory all these privileges fall within the prerogative of the Crown; yet, with the exception of such as are purely personal, and the conferring of honors (which are usually conferred on the initiative of the

Premier), they are exercised by the responsible minister of the Crown, chosen from that party which has, for the time being, a majority in the House of Commons.

B. As a substantive:

Church Hist. & Ecclesial. (17): Those who believe that the government of the church by means of presbyters is "founded on and agreeable to the word of God." They hold that presbyter (elder) and bishop are different names for the same ecclesiastical functionary (cf. Acts xx. 17, 28, R.V., Phil. i. 1, &c.); that, consequently, every presbyter is a bishop, and on a footing of equality with his other brethren in the eldership. Presbyters are divided into two classes—teaching and ruling elders (1 Tim. v. 17). The former are popularly called "ministers," the latter "elders," or "lay-elders;" but, theoretically, both hold spiritual office. The government is by means of four courts of judicature, using consecutively in dignity and authority. The lowest—called in Scotland, &c., the "Kirk-session," or simply the "Session" [KIRK-SESSION], rules over the congregation in all spiritual matters; while finance, being deemed more secular, is relegated to "deacons or

fâte, fát, fare, amidst, what, fall, father: wê, wêt, here, eamêl, hêr, thêre: pine, pit, sire, sir, marine: gô, pôf, or, wôre, wôlf, wôrkl, whô, sôn: mûte, cûb, cûre, unite, eûr, rûle, fûll: trý, Sýrian. æ, œ = ê; ey ≈ â; qu = kw.

managers. Above the Session is the Presbytery (q.v.). Above this again is a Synod for a province; it is held half-yearly. Highest of all is the General Assembly, meeting annually. The minister of a congregation presides *in officio* in the Session, and non-ministerial elders are ineligible for the Moderatorship of the Presbytery, Synod, and Assembly. A Presbyterian denomination stands to an Episcopal one nearly in the same relation as a republic to a monarchy. The Waldensian church was constituted on an essentially presbyterian model. The system was partially introduced into Switzerland in 1541, and its discipline was subsequently carried out by Calvin with iron firmness at Geneva. The first French Synod met in Paris in 1559, the first Dutch Synod at Dort in 1574. The Hungarian and various other continental Protestant churches are also Presbyterian. The system thoroughly rooted itself in Scotland, the first General Assembly being held there in 1560. [CHURCH OF SCOTLAND.] The same year a presbytery was formed in Ireland, at Carrickfergus (SYNOD OF ULSTER), and in 1572 one in England, at Waudsworth. In 1646-7 the Church of England was reconstituted on a presbyterian basis, but in 1660 was again made episcopal. [CHURCH OF ENGLAND.] The clergymen who had to leave the English Church, in 1662, owing to the Act of Uniformity, were mainly Presbyterians. A number of the congregations which they founded ultimately lapsed, first into Arianism, and then into Socinianism, retaining the name Presbyterian after they had abandoned the form of government. But the great mass of the British and American Presbyterians are strongly Trinitarian. They hold the Bible to be the sole rule of belief, and the Confession of Faith their chief, or their only, human standard. In 1836 two presbyteries in England in connection with the Church of Scotland were united into a Synod; two more were added in 1839. In 1843 they asserted their independence of the Scottish Church, calling themselves the "Presbyterian Church in England." In 1876, they and the English congregations of the United Church joined to form the "Presbyterian Church of England." The first presbytery in the New World met at Philadelphia in 1705. There are now powerful Presbyterian churches in America and the British colonies.

The Moderator opens and closes each meeting with prayer. The functions of the court are executive, not legislative. Presumptuous are of three degrees — Violent, in which those circumstances appear which necessarily attend the fact; probable, arising from such circumstances as usually attend the fact; and light (without validity). A presumption "juris de jure" (of law and from law) is where law or custom assumes the fact to be so on a presumption which cannot be traversed by contrary evidence. A presumption "juris" (of law) is one established in law until the contrary is proved. A presumption "hominis vel judicis" (of the man or judge) is one which is not necessarily conclusive, though no proof to the contrary be adduced.

A descendant of Aaron, and therefore one of the sacred caste. The Jewish priests filled all the important offices in connection with the tabernacle and then with the temple worship, less important ones being handed over to the Levites, and those still more menial to the Nethinims (cl.v.). They constituted a sacred hierarchy, of which the high priest was the head. Their chief duties were to offer sacrifices for themselves and the people, and intercede for them with God. The priests were divided into twenty-four courses for the service of the temple (1 Chron. xxiv. 1-19; Luke i. 5). Probably the "chief priests" were the heads of these courses, with any high priest out of office (Matt. xxvi. 3).

pr i m a t es, *s. pl.* [Lat. pl. of *primus*, genit. *primi*, = principal, chief.]

Zool.: The first and chief of Linnaeus's orders of the class Mammalia. He included under it four genera—Homo (one species, five varieties), Simia (twenty-one species), Lemur (three species), and Vespertilio (seven species). Cuvier ignored the order, classing Man as *Primata* (Owen's *Archænopterygia*) and Apes and Lemurs as *Quadrumana* (q.v.); the Bats now constitute an order by themselves (Chiroptera), and the Lemurs rank as a sub-order (Lemuroidea). With the advance of zoological and anatomical knowledge the use of the name has revived "for the Apes, not only by naturalists, who, like Huxley, retain Man within its limits; but also by others (e.g. Prof. Eschsché, Geoffrey St. Hilaire and Gervais) who consider he should be excluded from it" (St. G. Me. *ist.*, in *Europ. Brit.*, vol. 9th, n. 148). Prof. Flower (*Europ. Brit.*, vol. 9th, xv, 144), breaks up the order into five families.

The hallux is always provided with a fat nail (with occasional individual exceptions), and is capable of a considerable amount of abduction and adduction.* He divides it into three sub-orders: (1) Anthropoide, (2) Simioide (Apes and Monkeys), and (3) Lemuroide.

* Moreover, as man is the highest animal, and zoologically considered, differs less from even the lowest ape than such ape differs from any other animal, man and ape must be placed together in one order, which may well bear its primitive Sanscrit name, *Primateis*.—Prof. Me. *ist.*, in *Europ. Brit.* vol. 9th, n. 162.

Samuel Starkey, was closely associated with the sect, and the members were sometimes called, after him, Starkeyites. Means to establish a community at Spaxton, near Charlhuch, with Prince at its head, were obtained by "leading captive silly women;" and the nature of the community is sufficiently indicated by its name—The Agape-mone (q.v.). "The principle on which the sect was ultimately consolidated was that Jesus having suffered to redeem the spirit only, and left the flesh alienated from God, Prince took upon himself new flesh to redeem the flesh, and whosoever believes on him will not die, but will henceforth be without sickness or pain." In 1902 public attention was again called to the sect by the claims of the Rev. Smyth Pigott. [AGAPEMONE.]

C. As substantive:

1. The act, process, or practice of impressing letters, characters, or figures on paper, cloth, or other material; the business of a printer; typography. There are several branches of the art, as, the printing of books, &c., by means of movable types; the printing of engraved steel or copper plates [ENGRAVING]; the taking impressions from stone [LITHOGRAPHY], and the printing of figured patterns on fabrics [CALICO-PRINTING]. Letterpress-printing, or the method of taking impressions from type or letters, and other characters cut

or cast in relief upon separate pieces of metal, is the most important branch of printing. The first step towards the invention of printing was the practice of taking impressions of pictures with short descriptions beneath, from blocks of wood carved with a knife. Next followed a series of blocks printed on one side only of the paper, and the leaves pasted together to form a book. The next step was the invention by John Gutenberg of the use of movable metal types cast in a mould. After long experiments at Strasburg, which involved him in a lawsuit, Gutenberg removed to Mainz, where he succeeded in producing the Latin Bible about 1452-3, the marvel of afterages for perfection of typography. The first book printed with a date is the Latin Psalter, 1457, the opening page of which has a decorated letter B in three colours, of exquisite beauty of design and execution. The first book printed in Italy was *Debutus* (Salsone, 1455); in France, *Vergerius Epistole* (Paris, 1470-1); in England, *The Doctes or Sayings of the Philosophers* (Westminster, 1477); in Spain, *Sallustius* (Valencia, 1474). The first book printed in Holland with a date appeared in 1473. Some maintain that Gutenberg derived his knowledge from Coster of Haarlem. In letterpress printing the impressions are taken directly from the surface of the types, or from stereotyped plates (STEREOTYPE) by superficial pressure, as in the hand printing-press, or by cylindrical pressure, as in the steam printing-machine, or by the action of a roller, as in the copper plate press. The ink or pigment employed is laid upon the surface of the type with a printer's roller. Printing is divided into two departments, composition and press-work. (See these words.) In printing the blind the letters or characters are impressed in relief on stout paper or cardboard without the use of ink.

2. *Photog.:* The process of obtaining proofs from negatives. [AUTOTYPE, PHOTOCOLOTYPE, PLATINOTYPE, POWDER-PROCESS, SILVER-PRINTING, STANNOTYPE, WOODBERRYTYPE.]

printing machine, s. A machine for taking impressions on paper from type, electrotype, or stereotype formes, steel or copper plates, lithographic stones, &c. It is moved by hand, or by steam, or other power. The impression from the formes is generally effected by cylindrical pressure. Letterpress printing machines are of three kinds: (1) Single cylinder, by which the sheet of paper is printed on one side only; (2) Perfecting, which prints both sides of the sheet at one operation; and (3) Platen, which prints one side of the sheet by flat, instead of cylindrical, pressure. There are also various kinds of Rotary machines used for printing newspapers, into which the paper is drawn from reels, instead of being fed by single sheets. The first cylinder printing machine was patented by W. Nicholson in 1790. On Nov. 29, 1814, the *Times* was for the first time printed by machinery, at the rate of 1,100 copies per hour, by a machine invented by Koenig. This machine was, however, very complicated, and was soon after superseded by one invented by Messrs. Applegarth and Cowper, in 1827, by which a rate of 8,000 copies per hour was attained. Since then successive improvements have been made, enabling as many as 30,000 or more copies per hour to be printed.

A coil of wire for running the forme in and out was afterwards added. In the printing press the matter to be printed is laid on an even horizontal surface, usually of iron, and the pressure is produced by a parallel surface, also usually of iron, called a platen, by means of a screw or lever, or both combined.

A conventual prior is the head of a religious house, either independently, as among the Regular Canons, the Carthusians, and the Dominicans, or as superior of a cell or offshoot from some larger monastery. privy council, s. The principal Council of the sovereign, consisting of members chosen at his or her pleasure. Its dissolution depends upon the royal pleasure; by common law it was dissolved *ipso facto* by the demise of the sovereign, but to prevent the inconvenience of having no council in being at the accession of a new prince, the privy council is enabled by statute to continue for six months after the demise of the crown, unless sooner dissolved by the successor. It is presided over by the Lord President of the Council, who has precedence next after the Lord Chancellor. Members of the privy council are addressed as Right Honourable. The duty of a privy councillor appears from the oath, which consists of seven articles:

1. To advise the king according to the best of his conscience and discretion; 2. To advise for the king's honour and good of the public, without partiality through affection, love, malice, or dread; 3. To keep the king's counsel secret; 4. To avoid corruption; 5. To help and strengthen the execution of what shall be there resolved; 6. To withstand all persons who would attempt the contrary; and lastly, he general, councilor ought to do to his sovereign lord.

The office of a privy councillor is now confined to advising the sovereign in the discharge of executive, legislative, and judicial duties. The former have since the accession of Queen Anne, been entrusted to responsible ministers; and it has consequently become the settled practice to summon to the meetings of the council those members of it only who are the ministers of the crown. The power of the privy council is to inquire into all offences against the government, and to commit the offenders for trial; but their jurisdiction is only to inquire and not to punish, except in the case of the judicial committee, which has full power to punish for contempt and to award costs. The duties of the privy council are, to a great extent, performed by committees, as the judicial committee, who hear allegations and proofs, and report to the sovereign, by whom judgment is finally given, and the committee of council on education, presided over by the Vice-president of the Council, who is a member of the government.

From Molina's death till about 1650 Probabilism flourished, and then a reaction set in in favour of Probabiliorism (q.v.). St. Alphonsus Liguori (1702-87) in his *Hom. Apostolicus* and *Theologia Moralis* revived Probabilism, which is now the ordinary rule of confessors in the Roman Church.

the promisee, from the nature of his proposal, thinks it unnecessary to wait for the other party's assent, which he takes for granted. An offer is not bound until his offer is accepted. A promiser is bound as soon as the promise reaches the party to whom it is made. A promise may be absolute or conditional, lawful or unlawful, express or implied. An absolute promise must be fulfilled in all events. The obligation to fulfill a conditional promise depends on the performance of the condition. An unlawful promise is not binding, being void by the nature of it, as being incompatible with a prior paramount obligation of obedience to the laws. An express promise is one expressed in words or writing. An implied promise is one which reason and justice dictate. A promise without deed is said to be parol, and the term is usually applied to engagement by parol only, a promise by deed being technically called a covenant (q.v.).

* 1. The Prophets:

(1) Men divinely inspired, and who often uttered predictions of future events. These words are applied to the Old Testament prophets; the most common is שׂוֹפֵר (shofar), from the verb שָׂפַח (shaphach) = primarily, to bubble forth, to send forth copious floods of speech, hence in Niph'al = to speak under a divine impulse, to prophesy (1 Sam. ix. 9; 1 Kings xx. 1); the second שֹׁפֵט (shofet) = a seer, from שָׂפַח (shaphach) = to see (1 Sam. ix. 9), and the third שֹׁפֵט (shofet) = a seer, from שָׂפַח (shaphach) = to see, to look (1 Chron. xvi. 9; xxv. 7, &c.). It is connected with שֹׁפָר (shofar) = a vision. The second term was the oldest (1 Sam. ix. 9). Both it and shofar suggest that the subjects of the prophecies passed before the eyes of the seer in panoramic vision (cf. Isaiah i. 1; Ezek. i. 4; Rev. i. 12), he simply recording what he saw. In many cases, however, words were communicated (Jer. i. 4, 9, 11, 12). The first word shofar, suggested that when inspired communications had to be made, the prophet, like a frenzied person raving, uttered words in a copious flood, flowing forth with some considerable impulse. Abraham is called a prophet (Gen. xii. 7); it is implied that Moses was one (Deut. xxxiv. 11; Acts vii. 35), but the more typical prophets began with Samuel (Acts xiii. 20), who was a civil ruler as well. Yet the full development of the prophetic order was not till the separation between the two kingdoms. In Judah the general faithfulness to Jehovah left them less scope. In the kingdom of Israel, on the other hand, where the worship, even when nominally that of Jehovah, was idolatrous, and where that of Baal often prevailed, the prophets were very prominent and influential, denouncing apostasy and moral depravity. The first, like Elijah, Elisha, &c. have left no writings; the later prophets, however, (Ez.) The last of the Old Testament prophets passed away with Malachi, and scribes took their place. In the early church there were prophets (Rom. xii. 6; 1 Cor. xii. 28; Ephes. iv. 11, &c.). Their chief function seems to have been preaching in the church (1 Cor. xiv. 2-5).

(2) The prophetic books of the Old Testament, or the Old Testament except the books of Moses (Matt. xvii. 40; Luke xxiv. 27).

2. School of the Prophets: An association of the prophets in which the elder lovingly trained the younger, who were called their sons (1 Kings xv. 35). First Elijah, and then Elisha, presided over such a society.

2. *Arith.* : A rule by which from three given quantities a fourth may be found bearing the same ratio to the third as the second bears to the first. Also called the Rule of Three.

3. *Math.* : The relation which one quantity bears to another of the same kind, with respect to magnitude or numerical value. This relation may be expressed in two ways : (1) by the difference of the quantities, and (2) by their quotient. When the relation is expressed by their difference, it is called an Arithmetical Proportion ; when by their quotient, Geometrical Proportion, or simply Proportion. Four quantities are in proportion when the ratio of the first to the second is equal to the ratio of the third to the fourth ; this relation is expressed algebraically thus, $a:b::c:d$. This expression is called a proportion ; it is read, *a* is to *b* as *c* is to *d*, and is equivalent to the expression $\frac{a}{b} = \frac{c}{d}$. Hence, a proportion may be defined to be the algebraic expression of equality of ratios.

1. Exemption from arrest in civil suits. [ACTS, *s.*, B. I. 1.] Also a special protection given by virtue of the royal prerogative against suits in law or other vexations, in respect of the party being engaged in the sovereign's service.

II. *Polit. Economy*: Protection in this sense is said to have been derived from the name of the Society for the Protection of Agriculture (1841-53). But the idea is old, and has been known to a greater or less extent in all ages and in all lands. Taxes levied solely for the raising of revenue operate in restraint of free trade, and are therefore a form of protection, but the term is generally limited to cases in which these taxes are imposed for other than fiscal purposes. Their most common aim is to shield some languishing trade, occupation, or profession from open competition. Free Traders urge that protection to the farmer makes every loaf smaller, this taxing for the benefit of a class the very poorest person in the country, and aggravating the effects of any famine that may arise. [CORN-LAWS.] Navigation laws make it more expensive to work a ship, and diminish the probability of its being largely employed in the carrying trade of the world. [NAVIGATION-LAWS.] A bounty on exportation is a present made to foreign countries, and *vice versa*. [BORNTY.] It is believed that the protectionist system on a large scale was first proposed by the Chancellor de Briague, an Italian in the suite of Catherine de Medici. It was developed by Colbert in 1664, and has not since passed away. In 1692 England retaliated on France, according to Adam Smith, taxing goods imported from that country in 1696 75 per cent. or more. Bounties were abolished in Britain between 1818 and 1824, and this, with the repeal of the Corn and Navigation Laws, dealt a severe blow to the protectionist system in this country. Since then the "Revivers" have attempted to restore Protection to its former position. Some of its doctrines have been advocated under the name first of Reciprocity and then of Fair Trade. [TRADE.] In 1903 the advocacy of Protection, especially in the form of Retaliatory and Preferential Tariffs, was actively revived by Mr. Joseph Chamberlain and his followers. In many of the colonies, and in the United States, protection still carries with it the masses of the people and the government, though a minority are in favour of Free Trade.

Biol., &c.: "The living matter from which all kinds of living beings are formed and developed, and to the properties of which all their functions are ultimately referred" (*Encyc. Brit.*, ed. 9th, xix, 828). It was first noticed and described by Roesel v. Rosenhof, in his account of the Protozoa animalcule, and was named sarcode by Dujardin in 1835. In 1846 v. Mohl gave the name *protoplasm* to the "tough slimy granular, semi-fluid" portion of the contents of the vegetable cell. Cohn suggested the identity of vegetable protoplasm and animal sarcode, which was established by Schultze (*Arch. f. Anat. u. Phys.* [Leipzig], 1861, pp. 1-27), whose conclusions were probably aided by the researches of De Bary and Koelliker. Protoplasm is a transparent homogeneous, or granular-looking substance. Under high microscopic power, in many instances, it shows a more or less definite structure, composed of fibrils more or less regular, and in some instances grouped into a honey-combed or tubular reticulum, in the meshes of which is a homogeneous interstitial substance. The closer the meshes of the reticulum, the less there is of this interstitial substance, and the more regularly granular does it appear. Water, dilute acids, and alkalis cause protoplasm to swell up, and ultimately become disintegrated, and it is coagulated by those substances that coagulate proteins. Its composition is a problem with which science has still to deal.

psalm (*psalmo*), **psalme, salm,** *s.* [Lat. *psalmus* (Gr.), from Gr. ψαλμός (*psalmós*) = a touch, i.e., respect, the strings of a harp, the sound of a harp, a song, a psalm, from ψάλλω (*psallō*) = to touch, to twang; A.S. *psalm*, O. F. *psalm*, *psalm*, *psalm*, Sp. & Ital. *psalmo*, Port. *psalmo*.] A sacred song or hymn; a song or hymn composed on sacred subjects, and in praise of worship of God, i.e., one of the hymns composed by David, and other Jewish sacred writers.

1. The Book of Psalms:
[Old Test. Canon; Heb. פְּסַלְמִים (*tehillim* or *tehillim*), an abnormal pl. of *masa*, form to the fem. תְּהִלָּה (*tehillah* or *tehillah*) = (1) praise; (2) a hymn of praise; (3) glory. In the *Septuagint* the Septuagint calls the book *Ψαλμοί* (*psalmoi*) = Psalms, in another *Ψαλτήριον* (*psalterion*) = a stringed instrument. It was the praise book of psalter of the Hebrews in the synagogue. In the present Hebrew Bible it is placed just after the Prophets at the head of the Hagiographa (q.v.), and in Heb. xxv. It is generally supposed to stand by that division of the Old Testament books. The ancient and fifty psalms are arranged in Hebrew in five books, each terminating with a *doxology*, in some cases closing with "Amen Amen." The R.V. prints them separately. Book 1 contains 114; book 2, xlv. xxxv. book 3, lxxv. lxxxix.; book 4, xc. cv. and book 5, cv. cl. All but thirty-four psalms have titles in the Hebrew Bible; the latter were called by the Rabbinic psalm titles. In the Septuagint all but two have titles, though not as a rule accepted as part of Scripture they are ancient, and worthy of such respect. They attribute all Book 1 to David except Ps. i., x., and lxxxiii. The name of the Supreme Being used in this book is chiefly Jehovah. Book 2 assigns Psalms to David, to Kishai, to Asaph, and to Solomon, and leaves others anonymous. The name for the Supreme Being in this book is Elohim (q.v.). Book 3 ascribes Psalms to David, to Kishai, to Asaph, to Ethan, and to Heman (q.v.). *1. 1.* Elohim and Jehovah are about equally common in the book, the former being apparently preferred. Book 4 contains Ps. c. to Moses, the others not referring to David. Book 5 leaves many psalms anonymous, attributing others to David. The Hebrew Bible, but not the Septuagint, assigns Psalms xxxv. to Solomon. The *Septuagint* calls the Songs of Degrees. The book was evidently brought together in many sources. It was commenced, after their ordinary completion, by David's composition and compilation extended

over centuries. Psalm cxxxviii, speaks of the Babylonish captivity as an event recently gone by. Psalm xlv. and lxxxix. seem very suitable to the time of the persecution under Antiochus Epiphanes (167-164). If the Talmudic statement, discovered by Grotz, that the night services allowed to be in Ps. lxxxviii, did not become part of the Jewish ritual till the time of Queen Alexandra (70-70), it, and perhaps others of the Songs of Degrees may be still the more recent than that date. The book of Psalms is quoted in alluded to as inspired composition, by our Saviour and his Apostles at least seventy times. The Old Testament book is more frequently quoted. Its canonical authority has never been seriously doubted. It has become the psalter of the Christian Church. Its rhythmical form and careful parallelism (q.v.) (now rendered obvious by the R.V.) adapt it for the musical part of public worship. [Miss. Eng.]

These *pseudopodia* are sometimes of short life, at others of extended duration. When they are of the former kind, they are called *locomotory*, their outlines are clear and transparent, and the granules which they now contain pass off. They are not true feet, in the sense of the word, but when they are firm they are very apt to run into one another, and are then found to be distinct, filaments of which, however, they separate, and remain their previous form, and whether they do this or not, the surface of these *pseudopodia* are often beset by minute granules, which are inconstant in their position. Biol.: (See extract.)

The young of viviparous Aphides are developed within organs which resemble the ovarioles of the true females in their disposition, and may be termed *pseudovaries*. The anterior chamber of each pseudovarium tube is lined by an epithelium, which encloses a number of nucleated cells. One of the hindmost of these cells enlarges, and becomes detached from the rest as a pseudovum. It then divides, and gives rise to a cellular mass . . . which gradually becomes fashioned into the body of a larval Aphis. A portion of the cells of which it is composed becomes converted into a *pseudovarium*, and the development of new pseudovaria commences before the young leaves the body of its parent. It is obvious that this operation is comparable to a kind of budding. If the pseudovum remained adherent to the parental body the analogy would be complete. (*Hosley*: *Anat. Invertebr.*, III, 447, 448.)

1. *S. v. l.*: The typical genus of the group Pterop. 2. Muscle long, narrow, and cylindrical, nostrils projecting; upper lip a vertical groove in front of tailless; insectivorous membrane deeply emarginate behind, in some species scarcely developed in the centre. This genus includes the largest and some of the most brilliant coloured of the Chiroptera. Dobson-*monstrosus* and describes forty-one species. The bright-hued fur of some of these bats is probably due to protective mimicry. Dobson (*Brit. Chiropt.*, p. 17, Note 6) says:

PTEROPUS.

"Any one who has seen a colony of these Bats suspended from the branches of a banyan tree, or from a silk-cotton tree, must have been struck with their resemblance to large ripe fruits; and this is especially noticeable when they hang in clusters from the leaf-stalks of the second palm, where they may be easily mistaken for a bunch of ripe coconuts."

2. *P.*: The typical group of the Pteropodidae (q.v.), with six genera: Eponorphus, Pteropus, Cynonycteris, Cynopterus, Harepygia, and Cephalotes.

Etym.: An order of flying Reptilia of Mesozoic age. No exoskeleton; dorsal vertebrae procoelous, anterior trunk-ribs double-headed; broad sternum, with median keel, and ossified sternal ribs. Jaws generally armed with teeth, implanted in distinct sockets. Supported by this finger, the side of the body, and the comparatively short hind limb, was a patagium, or flying membrane. The bones were pneumatic. Chief genera: Pterodactylus, Dimorphodon, Rhamphorhynchus, Pteranodon, and Ornithopterus. Prof. Seeley, having regard to the ornithic type of brain, and the pneumaticity of the bones of the Pterosauria, places them in a distinct class, Ornithosauria which he regards as most nearly related to, but coequal with, the class Aves. Marsh separated from the order the group Pteranodontia (q.v.), in which he has been followed by Gauthier and St. G. Mivart.

John Hunter and Macartney had previously noticed these feather-tracts; the remarks of the latter were published in 1819 (*Jess's Cyclop.*, art. Feathers), and Owen introduced Hunter's observations into his *Catalogue* of the Museum of the College of Surgeons (vol. iii., pt. ii., p. 311), but in neither case is there any indication of the taxonomical value of the distribution of the pteryle, which has since been recognised.

1. *Lat.* & *Grecin*: *Fulvulina orctica*, a common English sea-bird, with many popular names—*Bottle-nose*, *Coat-tail*, *Pope*, *Sea-Parrot*, and *Tummy Noddy*, with others that are only locally known. By extension, the name is applied to other species of the genus. The Common Puffin is well known all round the British coasts, and gives its name to one of its haunts—Puffin Island, off Anglesea. It is rather larger than a pigeon; plumage glossy black above, under-surface pure white; feet orange-red; bill very deep, and flattened laterally, partitioned—red, yellow, and blue, and grooved during the breeding-season, and undergoing a kind of moult at its close—a peculiarity shared by other species. (Cf. *J. Bingley*; *Four Royal North Wales*, i. 309, and a paper by Dr. Bureau, in *Bull. Soc. Zool. France*, ii. 377-391, an abstract of which appeared in the *Zoologist*, July, 1878.) Puffins lay a single egg—white, with gray markings—in a barrow sometimes excavated by themselves, but frequently in one from which a rabbit has been driven. They were formerly used for food, and being "reputed for fish" (*Carew*; *Sure*, *Coron.*, fol. 35), were eaten in Lent.

— *There cannot be much doubt that the name Puffin given to these young birds, salted and dried, was applied on account of their downy clothing, for an English informant of Gesner's described one to him (*Hist. Avium*, p. 119) as wanting fine feathers, and being covered only with a sort of woolly black plumage. It is right, however, to state that Caus expressly declares (*Harior. anim. lib.*, fol. 21) that the name is derived 'a naturali voce pupin'. Prof. Skeat says that the word is a diminutive, which favours the view that it was originally used as a name for these young birds.' — *Prof. Seeboin*, in *Encyc. Brit.* (ed. 9th), xx. 191. (Note.)*

For the transference of sense of *horse* = a kind of frame; Fr. *pulet* = a filly, etc.; a beam; *charrue* = a goat, etc.; a crane; Eng. *crane* = an its double meaning; Fr. *vois* (*vois*) = an ass, a crane, a pulley, etc.]

1. *Mech.*: One of the six simple machines or mechanical powers. It consists of a small circular plate or wheel which can turn round an axis passing through the centres of its faces, and having its ends supported by a frame-work which is called the block. The circular plate has a groove cut in its edge to prevent a string from slipping off when it is put round the pulley. With a single fixed pulley (that is one in which the block in which the pulley turns is fixed), there is neither gain nor loss of power; for, as the tension in every part of the cord is the same, if a weight be suspended at one extremity, an equal weight must be applied at the other to maintain equilibrium. Hence, the effect of a fixed pulley is simply to change the direction of a force. By means of moveable pulleys one can gain mechanical advantage, greater or less, according to the number and mode of combination of the pulleys. This advantage may be computed by comparing the velocity of the weight raised with that of the moving power, according to the principle of virtual velocities. Thus:

In a single moveable pulley with the strings parallel when there is equilibrium the weight is twice the power.

It may, therefore, be considered a lever of the second class, in which the distance of the power from the fulcrum is double that of the weight from the fulcrum.

In a system of pulleys in which each pulley hangs by a separate string and all the pulleys are parallel, when there is equilibrium the weight is equal to the power multiplied by 2ⁿ, where *n* is the number of pulleys.

In a system of pulleys in which the same string passes round all the pulleys and the parts of it between the pulleys are parallel, when there is equilibrium the weight is equal to the power multiplied by the number of strings at the lower block.

In a system of pulleys in which each string is attached to the weight, and all the strings are parallel when there is equilibrium, the weight is equal to the power multiplied by 2ⁿ⁻¹, where *n* is the number of pulleys.

2. *Mach.*: A wheel with a groove, flat, or slightly convex rim, adapted to receive a cord or band, which runs over it. It transmits power or changes the direction of motion.

(5) *Sliding pulley*: A kind of coupling in which the band-pulley is slipped into or out of engagement with an arm freely attached to the shaft and rotating therewith.

(*Abbt's Dictionary*) The existence of a purgatory was defined by the Councils of Florence (1439) and Trent. At the latter council (sess. XXV, Dec. 3, 4, 1562) it was declared that the "souls in Purgatory are assisted by the suffrages of the faithful, and especially by the Sacrifice of the altar. Beyond this nothing is defined, and the same decree enjoins bishops "to abstain from dilute and subtle questions" in their discourses on the subject, and prohibits curious inquiries, superstitious practices, and the making of purgatory a source of gain as "scandals and stumbling-blocks to the faithful."

3. Anglican: Art. XXII. treats of Purgatory, and most Protestants consider that it denies Scriptural evidence for the existence of such a place. High Churchmen, on the contrary, hold that the Anglican Church has no authoritative teaching on the point, and that the article is rather directed against an erroneous view of the Roman doctrine than that doctrine itself. Prayers for the dead, the natural outcome of the doctrine of purgatory, are in many instances offered privately by her members, and in some few instances publicly requested in her churches.

On these festive days the book of Esther is read, presents are interchanged, and gifts are sent to the poor. 1. **Ord. Lang. & Chem.**: The apparently spontaneous decomposition of organic substances, especially those rich in nitrogen. It differs from fermentation (q.v.) in being accompanied by the evolution of fetid and noxious gases. In the process of putrefaction, organic bodies of a higher order are changed, sometimes into lower organic compounds, sometimes into inorganic compounds, as ammonia, sulphuretted hydrogen, &c., and sometimes into simple substances, as hydrogen and nitrogen. Putrefaction may be prevented, or its further progress arrested by various means:

(1) By keeping the substance in a vacuum, or in a vessel containing air which has been deprived of all organic germs.

(2) By freeing from moisture and keeping perfectly dry.

(3) By keeping the substance in an atmosphere a few degrees above 9°.

(4) By heating to the boiling point, and hermetically sealing.

(5) By the use of antiseptics, as salicylic acid, &c.

From experiments made by Pasteur and others, it appears that putrefaction only takes place when a body comes in contact with living germs. (Used also figuratively.)

pýr òm ò tēr, s. [Pref. *pyro-*, and Eng. *meter* (q.v.).] A term originally applied to an instrument in the form of a single metallic bar, employed by Muschenbroek about 1730, to indicate temperatures above the boiling point of mercury, 660 Fahr. It is now applied to any instrument used for such purpose. The first which came into extensive use was that of Wedgwood, about 1780; it was devised and used by him for testing the heat of his pottery and porcelain kilns. No fewer than eleven different modes have been proposed or actually employed for measuring high temperatures: (1) by contraction of clay on exposure to heat, as in Wedgwood's; (2) by expansion of bars of different metals; (3) by change of pressure in confined gases; (4) by the amount of heat imparted to a cold mass; (5) by the fusing-point of solids; (6) by conduction and radiation of heat, depending upon observations with thermometers of moderate range at relative distances (PYROSCOPE); (7) by colour, as red and white heat; (8) by change in velocity of sounds depending on the change of pitch in musical notes; (9) by resolution of chemical compounds; (10) by generation of electricity, as in Becquerel's thermo-electric pyrometer; (11) by change in resistance to electricity, as in Siemens's pyrometer, which depends on the increased resistance offered by an iron or platinum wire to the passage of electricity. Of all these, the third (M. Lamy's), depending on the measurement of the tension of carbonic-acid gas developed from marble when heated, and the last are the best.

Trenschmidt's pyrometer is founded on the expansion of a thin plate of platinum, heated by a mass of metal previously raised to the temperature of the medium. The Trampier pyrometer is based upon the difference in the coefficients of dilatation for iron and graphite; the Gauntlet pyrometer on the difference of those of iron and fire-clay. The Ducrest pyrometer consists of a series of rings made of alloys which have slightly different melting points. In pyrometers constructed on the Watertype principle, the temperature is determined by noting the amount of heat communicated to a current of water of known temperature circulating in the medium to be observed. (*Nature*, xxx. (1844), pp. 366, 367.)

Two or more of these bases are always present, the most frequent being lime, magnesia, and protoxide of iron, lime being always present and in a large percentage. Sometimes these bases are replaced by sesquioxides, but always sparingly. The result of these isomorphous replacements is shown in the diversity of habit, colour, and form of its numerous varieties. Crystallization monoclinic. Hardness, 5 to 6; sp. gr. 3.25 to 3.7; lustre, vitreous to resinous; colour, shades of green, and white to black; transparent to opaque; fracture, conchoidal. The two most important divisions are Non-aluminous and Aluminous. Dana subdivides these into:

Q.

Q. The seventeenth letter and the thirteenth consonant of the English alphabet, a consonant having only one sound, that of *q* or *qu*. It is always followed by *u*, and since this combination can be represented by *kw* (or *k* when the *u* is silent), *q* is a superfluous letter. In Latin as in English, *q* was always followed by *u*. *Q* did not occur in the Anglo-Saxon alphabet, its sound being represented by *cw* or *cu*, as *cwæ* = Eng. *quack*, *cwæn* = Eng. *quæ*, *cwætan* = Eng. *quack*, &c. For *qu* in English the Dutch use *kw*, the Germans *qu*, the Swedes & Danes *qu*. *Q* is most commonly found as an initial letter; it never ends a word. The name of the letter is said to be from Fr. *quæ* = a tail, the form being that of an *o* with a tail to it.

I. *As an initial*: *Q* represents the Latin *Quæntus* in inscriptions or literature; in geometry, &c., it represents the Latin *quod* (= which), as *Q. E. D.* = *quod erat demonstrandum* = which was to be shown or proved; *Q. E. F.* = *quod erat faciendum* = which was to be done, abbreviations frequently written at the end of a theorem or problem respectively.

II. *As a syllable*:

1. *Q* was formerly used for 500, and with a dash over it, *Q̄*, for 500,000.

2. In the college accounts at Oxford for half a farthing. [C. 1, 2.]

quā, *adv.* [Lat.] In the character or quality of; as being; as, He spoke not *quā* a public official but *quā* a private person.

"It is distributed generally over the United States, residing permanently in the southern portion; in the Eastern states it is called the *quā bird*, from the noise it makes." *Ripley & Dana*, *Amer. Cyclop.*, xi, 448.

"Another division of propositions is according to their *quantity* [or extent]. If the predicate is said of the whole of the subject, the proposition is Universal; if of part of it only, the proposition is Particular or particular. E.g. Britain is an island. All islands are insular. Some islands are fertile. All islands are not insular, are not fertile, and their subjects, consequently, not distributed, being taken to stand for a part only of their significates."
Whately, *Logic*, bk. ii, ch. ii, § 1.

3. *Maths.* : Any thing that can be increased, diminished, and measured. Thus, number is a quantity; time, space, weight, &c., are also quantities. In Mathematics, quantities are represented by symbols (q.v.), and for convenience these symbols themselves are called quantities. [RATIONAL EXPRESSION.] In algebra, quantities are distinguished as known and unknown [ALGEBRA], real and imaginary, constant and variable, rational and irrational. Real quantities are those which do not involve any operation impossible to perform; variable quantities are those which admit of an infinite number of values in the same expression; rational quantities are those which do not involve any radicals. A simple quantity is expressed by a single term, as *a* or *b*; a compound quantity by two or more terms connected by the signs + (plus) or - (minus). Quantities which have the sign + prefixed to them are called positive or affirmative; those to which the sign - is prefixed are called negative. *Similar quantities* are such as consist of the same letters, and the same powers of the letters, as *abc*, = *2abc*, + *4abc*, &c. [CONSTANT, or, IMAGINARY, IRRATIONAL.]

Chem.: C₂₁H₃₀O₁₂. A substance extracted by alcohol from the leaves of the chestnut. It forms fine, yellow, crystalline grains of the size of poppy seeds, and is resolved by hydrochloric acid into quercetin and glucose, C₂₁H₃₀O₁₂ + 3H₂O = C₂₃H₁₆O₁₀ + 3C₆H₁₂O₆.

quér cêt a mide, s. [Eng. *quercetin* and suff. *-in*.]

Chem.: An amorphous, orange-yellow powder, obtained by treating an ammoniacal solution of quercetin with hydrochloric acid, filtering, and adding to the filtrate aqueous ammonia. It is slightly soluble in water, but soluble in alcohol, ether, hydrochloric acid, and excess of ammonia.

quér-cêt ie, a. [Eng. *quercetin* and suff. *-ic*.] Contained in or derived from quercetin (q.v.).

quercetic acid, s.

Chem.: C₂₃H₃₀O₁₂ or C₂₃H₃₄O₁₆. Formed by the action of boiling potash on quercetin. It crystallizes in silky needles, which effloresce in a warm atmosphere, is sparingly soluble in cold, easily in boiling water, in alcohol, and in ether. Its aqueous solution turns yellow on exposure to the air, and is coloured dark blue by ferric chloride.

quér cê tin, s. [Altered from *quercetin*.]

Chem.: C₂₇H₃₄O₁₂. A yellow, crystallizable body, produced by the action of dilute mineral acids on quercetin, C₂₇H₃₄O₁₂ + H₂O = C₂₇H₃₂O₁₂ + C₂H₄O₆. It is neutral, colorless, melts about 251; is slightly soluble in boiling water, easily in weak alcohol and in ether. Nitrate of silver and cupric oxide are readily reduced by it.

quér-çi mër-ic, a. [Lat. *quercus* = an oak; Gr. *μειρος* (*meiros*) = a part, and Eng. suff. *-ic*.] Derived from or containing quercetic acid.

quercimeric acid, s.

Chem.: C₂₁H₂₈O₆ = C₂₁H₂₈O₆. An acid produced by fusing quercetic acid with potash. It forms small, colorless, prismatic crystals, having an acid reaction and an astringent taste, and is very soluble in water, alcohol, and ether. Its aqueous solution gives a fine blue colour with ferric chloride.

quér-çin, s. [Lat. *quercus* = an oak; Eng. suff. *-in*.] [QUERCITE.]

quér çin-ê æ, s. pl. [Lat. *quercus* and fem. pl. adj. suff. *-inæ*.]

Lat.: A sub-order of Cupulifera or Corylaceæ. Male flowers with four to ten sepals, no corolla, simple filaments, and connate anther-cells. Female flowers one to three, in an involucre of many bracteoles, which enlarges in fruit. Ovary three- to seven-celled; axiles two in each cell; fruit in a capsule. Genera: Quercus and Fagus. (Sir J. Hooker.)

quér-çi tån-ñic, a. [Lat. *quercus* = an oak; *c* connect., and Eng. *tannic*.] Derived from or containing tannic acid.

quercitannic acid, s.

Chem.: An acid of unknown composition, found in oak-balls. It somewhat resembles gallo-tannic acid, but is not converted into pyrogallic acid by dry distillation. Sulphuric acid precipitates it in red floccs.

quér-çite, s. [Lat. *quercus* = an oak; Eng. suff. *-ite*.]

Chem.: C₆H₁₂O₅. Quercin. Quercitol. Sugar of acorns. A saccharine substance obtained from the aqueous extract of bruised acorns.

It crystallizes in transparent, monoclinic prisms, which are permanent in the air; melts at 235, and is soluble in water and hot dilute alcohol. Hot nitric acid converts it into oxalic acid; but a mixture of nitric and sulphuric acids changes it into a white amorphous resin, nitroquercite, which is insoluble in water, but soluble in hot alcohol.

quér-çi tõi, s. [Eng. *quercite* and suff. *-ite*.] [QUERCITE.]

quér-çit-rin, s. [Eng. *quercetin* and suff. *-in*.]

Chem.: C₂₃H₃₀O₁₂. A glucoside occurring in the bark of *Quercus tinctoria*, and extracted by boiling with water. It is yellow and crystallizable, and yields, when boiled with dilute acids, quercetin and isodulcitol. In solution it is neutral, bitter, and inodorous, and strikes a dark green colour with ferric chloride. When dehydrated, it melts at 169 to a dark yellow resin.

quér-çit-rôn, s. [Lat. *quercus* = an oak, and Eng. *citron*.]

Chem.: A yellow dye stuff, consisting of the shavings of the bark of *Quercus tinctoria*. Alum or stannic chloride is employed as a mordant. A finer yellow is said to be obtained when the decoction of the bark is previously boiled with dilute hydrochloric acid, owing probably to the liberation of quercetin. In America the bark is used for tanning.

quér-ri quér rê (qu as k), phr. [Heb. *קָרַע* (*qerâ*) = *quere*.]

Heb. Lit.: This expression, which is so frequently found in the margins and foot notes of both the MSS. and printed editions of the Hebrew Bible, is either the imperative or participle passive, and signifies *read (tho)*, or *it is read* (from *קָרַע* (*qerâ*) to *cut*). It is the technical expression for the various reading which the ancient readers of the text had its substitute for the one which occupies or is written in the text, i.e., *Kethibh* (272). The word in the text for which there is a variant has not only the vowel-points which belong to the marginal reading, but has a small circle or asterisk placed over it, which directs to the margin (27) where the emendation is given.

This, for instance, in Josh. v 1 the text has *קָרַע* which exhibits the letters of the textual reading, i.e., "we were passed over," with the vowel-points belonging to the *quere* or *quere* = the marginal reading, *קָרַע*, "they have passed over." The list of *quere*s, which is one of the most ancient and most important constituent parts of the Massorah (q.v.), is given in *The Massorah* (ed. Ginsburg), ii. 55-93.

2. *Theol. & Church Hist.*: The doctrine that the essence of true religion consists in the withdrawal of the soul from external and finite objects, and its quiet concentration upon God. It is a form of mysticism, and has been held by individuals in the Church in all ages. In the fourteenth century it attracted notice in connection with the Hesychasts. (HESYCHAST.) The term was specially used to describe the views advocated by Miguel de Molinos, a Spanish priest, who settled in Rome in 1669 and 1670, under the patronage of Cardinal Odescalchi, afterwards Innocent XI. In 1676 he published his *Guia spirituale* (Spiritual Guide), which was soon afterwards translated into Italian, French, Latin, and English. On August 28, 1687, the Inquisition condemned sixty-eight propositions in his writings, and on November 20 he was imprisoned for life, and died December 28, 1697. Among his followers was a Barnabite, François de La Combe, who instructed Madame Guyon. In 1694 a commission, with Bossuet, bishop of Meaux, at its head, combated thirty errors in her writings. She was defended by Fendon, bishop of Cambrai, whose writings in turn were condemned in 1699 by Pope Innocent XII, and retracted by their author. It was believed that the Quietist doctrine tended to disparage the external observances of religion and substitute the authority of the individual for that of the Church. In another direction also, quietism in some cases tends to anti-nomianism. (FAMILY OF LOVE.) Casper's verification of some of Madame Guyon's writings was first published at Newport Pagnell, in 1801, after the poet's death.
